

## ASEA TESSELATOR

832054

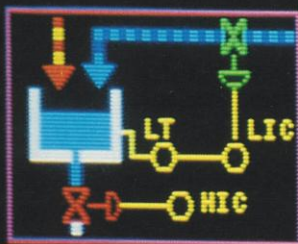

Improved readability. Simple composition of characters and symbols. Easier dialog with the host computer. Fulfills ergonomic demands.

These are the four important reasons why you should choose Asea's Tesselator for your next color graphic display system.

# ALLOW ME TO INTRODUCE MYSELF.

I'm TESSELATOR the color graphic display generator from ASEA that's almost human.

I'm human-engineered to make it easy for you to create process diagrams that use symbols, different character sizes and a variety of colors to give a clear, accurate and highly legible view of what's going on in your process.

## I'm symbol-oriented.

In minutes, I'll have you creating symbols that really mean something. And pictures that look real. So you can work with greater confidence.

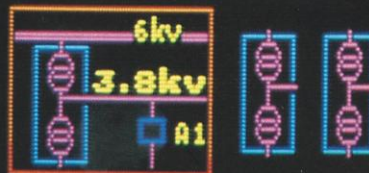

## I have a zoom function.

I can give you a closer look at any area of your display... and pan across the entire process picture simply by pushing a button. Or have the computer do it automatically-activated by a process event.

## I have a special "window" function that saves creative time.

Whatever you put inside my window can be stored in my memory and duplicated anywhere.

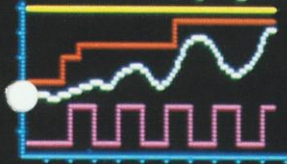

**I can put anything you create in my memory and bring it back instantly.**

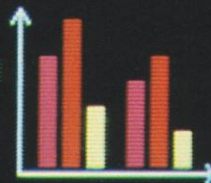

Up to 896 symbols and 100 pictures can be stored in my memory. Retrieve each one with a single key-stroke or corresponding ASCII-code from your host computer. This fast, easy dialogue frees your computer for other important tasks.

**● can help you spot trends.**

Display your process variables in analog trend or bar graph format. Be creative!

**I'm friendly with everybody.**

I can talk with people and computers in different languages, for example I have a complete software package for DEC computers. Communication is fast and efficient. And I'm particularly friendly with your bottom line.
